How do energy storage systems work?

Energy storage systems capture and hold energy for later use by shifting when and how electricity supply and demand are balanced. They're charged using electricity from the power grid during periods of low demand or extra capacity.

What is a battery energy storage system?

Battery Energy Storage Systems (BESS) are crucial for utility and energy companies, and at GTI Fabrication, we offer a wide range of manufacturing capabilities to provide BESS integrators with options that cover the entire Energy Storage Enclosure spectrum.

How will a 100MW battery energy storage system work?

The facility will serve as a large-scale battery energy storage system capable of charging from, and discharging into, the New York power grid. When fully functional, the 100MW battery energy storage project will be able to discharge electricity to the grid particularly during peak demand.

What types of energy storage are available?

Flow batteries and compressed air energy storage may provide storage for medium-duration. Two forms of storage are suited for long-duration storage: green hydrogen, produced via electrolysis and thermal energy storage. Energy storage is one option to making grids more flexible.
