Should solar panels be 12V or 48V?

Previously, with 12V systems, that meant adding more panels, larger capacity charge controllers, and huge battery banks, plus all that beefy wiring. Now, many solar consumers with higher energy demands are moving away from 12V and toward 24V and 48V systems for overall cost-space-benefit.

Is a solar panel wiring diagram required?

Yes, you need an electrical panel wiring diagram for the installation and permitting of your solar system to meet electrical panel requirements for solar. It is required before you can apply for a permit and pass final inspection.

Do I need a 12V or 48V inverter?

Simply put, if you have a 12V system, you need a 12V inverter; a 48V system requires a 48V inverter. Standard Pure Sine Wave inverters simply change DC power to AC power. Inverter Chargers handle this function plus allow you to charge your batteries off shore power or a generator. Renogy's 3500W Solar Inverter Charger is designed for a 48V system.

Should I size my solar panel if I'm backfeeding?

When backfeeding (sending power from your system through a circuit breaker in your electrical panel to the utility grid), it's important to size your solar panel to avoid overloading the electrical panel. Without these sizing restrictions, the combined energy from the utility grid and solar system could overload the electrical panel. Remember the 120% rule when sizing your system.

This outdoor battery cabinet is highly customizable and designed for telecom, power, and solar energy storage applications. It offers flexible configuration in structure, materials, cooling, ...

Below are some options for 12V, 24V, and 48V configurations, using Renogy 100W, 200W, and 320W
